

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended) A secure electronic entity, adapted to be connected to a host station, said secure electronic entity containing means for measuring time and comprising means for certifying a date of receipt of a command from said host station, wherein said certification means receiving from said time measuring means information on said date and produce data certifying said date intended for an external entity,

wherein the time measuring means are adapted to supply a measurement of time when said electronic entity is not supplied with power by an external power supply.

2. (previously presented) The secure electronic entity according to claim 1, wherein said certification means are adapted to supply a certified date.

3. (previously presented) The secure electronic entity according to claim 1, wherein said certification means are adapted to certify the authenticity of a date received from the outside.

4. (previously presented) The secure electronic entity according to claim 1, wherein said certification means are adapted to certify that said command has been received from said host station in a given time period or before a limit date.

5. (previously presented) The secure electronic entity according to claim 1, wherein it further includes synchronization means, said synchronization means are adapted to perform synchronization upon receipt of a message from said host station.

6. (previously presented) The secure electronic entity according to claim 1, wherein said certification means use authentication means, said authentication means are used to authenticate said data certifying said date.

7. (cancelled)

8. (previously presented) The secure electronic entity according to claim 1, wherein the time measuring means are adapted to supply a measurement of time when the electronic entity is not supplied with electrical power.

9. (previously presented) The secure electronic entity according to claim 1, wherein the time measuring means are adapted to supply a time measurement independently of any external clock signal.

10. (previously presented) The secure electronic entity according to claim 1, wherein the time measuring means include means for comparing two dates.

11. (previously presented) The secure electronic entity according to claim 1, wherein it includes at least one subsystem comprising a capacitive component having a leak across its dielectric space, means for coupling said capacitive component to an electrical power supply for it to be charged by said electrical power supply, and means for measuring the residual charge in the capacitive component, said residual charge being at least in part representative of the time that has elapsed since the capacitive component was decoupled from the electrical power supply.

12. (previously presented) The secure electronic entity according to claim 11, wherein said means for measuring the residual charge are part of said time measuring means.

13. (previously presented) The secure electronic entity according to claim 11, wherein the capacitive component is a capacitor implemented in the MOS technology and whose dielectric space consists of silicon oxide.

14. (previously presented) The secure electronic entity according to claim 11, wherein the means for measuring the residual charge comprise a field-effect transistor having an insulative layer, in that the capacitive component includes an insulative layer, and in that the thickness of the insulative layer of the field-effect transistor is much greater than the thickness of the insulative layer of the capacitive component.

15. (previously presented) The secure electronic entity according to claim 14, wherein the thickness of the insulative layer of the capacitive component is from 4 nanometers to 10 nanometers.

16. (previously presented) The secure electronic entity according to claim 13, wherein it includes at least two subsystems each comprising a capacitive component having a leak across its dielectric space, means for coupling said capacitive component to an electrical power supply for it to be charged by said electrical power supply, and means for measuring the residual charge in the capacitive component, said residual charge being at least in part representative of the time that has elapsed since the capacitive component was decoupled from the electrical power supply, said subsystems comprising capacitive components having different leaks across their respective dielectric spaces, and in that said secure electronic entity further includes means for processing measurements of the respective residual charges in said capacitive components to extract from said measurements information substantially independent of heat input to said entity during the elapsed time.

17. (previously presented) The secure electronic entity according to claim 16, wherein said processing means include software for calculating a predetermined function for determining said information as a function of said measurements substantially independently of the heat input.

18. (previously presented) The secure electronic entity according to claim 1, wherein it is portable.

19. (previously presented) The secure electronic entity according to claim 1, wherein it is a microcircuit card.

20. (previously presented) The secure electronic entity according to claim 1, wherein the secure electronic entity is an electronic tag.

21. (previously presented) The secure electronic entity according to claim 1, wherein said date determines a duration.
